Abstract of JP 2002159053 (A)

PROBLEM TO BE SOLVED: To provide a registration/authentication method of enabling registration and authentication to be surely and easily carried out between radio terminals or between a radio base station and radio terminals.

SOLUTION: A radio base station and radio terminals each have three modes, a normal mode, a register mode, and an authentication mode, and both the radio base station and radio terminals are capable of successively shifting from a normal mode to a registration mode, an authentication mode and then returning to a normal mode again, so that the radio terminals are registered and authenticated by the radio base station. Then the radio base station and radio terminals shift from one mode to the other, a user is required to manually operate a part of mode shift, so that an invalid user is restrained from enabling his radio terminal to be registered and authenticated.
